

Buisier Engineering is able to provide its Clients with an integrated field study that helps maximize clients ROI through improved completion and stimulation designs as well as techniques. The following inspection and testing services to the oil and gas industry.

## Production Enhancement for Existing Wells & Fields

A comprehensive engineering approach ensures that our clients maximize ROI and optimize stimulation effectiveness. Buisier Engineering offers field studies that can improve field performance. Whether on a single well or a multi-field property Buisier Engineering is able to provide its clients with an integrated field study that helps maximize clients' ROI through improved completion and stimulation designs as well as technique. Production Enhancement Plan (PEP) work progression comprises of the following.

- o Obtaining and analyzing wells histories.
- o Evaluating used completion and stimulation methods.
- o Assessing geochemical properties.
- o Evaluating critical I reservoir properties.
- o Integrating surface seismic data, incorporating Microsiesmic data.
- o Preforming net pressure modeling.
- o Analyzing production response,
- o Comparing and contrasting variables.
- o Optimizing the design.
- o Documenting the findings.
